ANALYST PROFILE

Who I Am & What I Deliver

I analyze complex datasets and translate them into executive-level decisions. My work spans customer retention, revenue and discount optimization, and workforce risk, always ending with a clear answer to: what should the business do next, and what does it cost to do nothing?

Revenue Protection

Identify churn and revenue leakage before they become losses

Data-Driven Decisions

Transform raw data into clear business actions with quantified impact

Executive Reporting

Dashboards built for non-technical decision-makers, one clear takeaway per page

Seeking Data Analyst or Business Analyst roles in Riyadh where data becomes strategy.

TECHNICAL ARSENAL

Power BI (DAX Measures, Data Model)

4 case studies · 5 dashboard pages

Microsoft Excel (Advanced)

PORTFOLIO AT A GLANCE

Four Projects, One Pattern

Each project: a problem, a finding, a decision, and a number labeled by how firm it is.

PROJECT	THE PROBLEM	WHAT THE DATA SHOWED	DECISION	THE NUMBER
01 **Customer Churn**	47.37% of customers leave, with no early warning.	Churn jumps past 15 days of payment delay (71%) and at 5+ support calls (61%).	A/B test a Day-10 payment alert and outreach at the 4th call.	**$15.8M** spent by churned customers MEASURED 5% SAVE = $792K, ILLUSTRATIVE
02 **E-Commerce**	$5.05M given up in discounts (15.4% of revenue).	Units per order stay about 3.0 at every discount level, 0% to 30%.	Re-price the 30%-off tier to 20%.	**$621K** recoverable at the same units CALCULATED
03 **HR Attrition**	16.1% of staff leave; HR finds out after the resignation.	Overtime: 30.5% leave vs 10.4%. Sales Representatives: 39.8% (33 of 83).	Overtime limit, plus retention plans for 309 high-risk employees.	**≈$6.8M** est. annual cost of exits ASSUMED (50% OF PAY)
04 **Sales Profitability**	The dashboard hid seasonality and discount losses.	5.6x gap, Nov vs Feb. Margin is 29% with no discount and -127% at 61%+.	Cap discounts; one trusted dashboard for executive meetings.	**−127%** margin at 61%+ discount MEASURED $42K–$85K, PLANNING RANGE

Common thread: in every case the loss was visible in the data before it happened. Each project ends with a decision, and no number is presented as more certain than it is.

CASE STUDY 01

Customer Churn: From Revenue Leak to Retention Strategy

Excel · Power Query · Power BI · DAX · 64,374 Customer Records · Public dataset (Kaggle) · 2026

47.37%	71%	61%	$15.8M
Churn Rate	Churn at Payment Delay >15 Days	Churn at 5+ Support Calls	Cumulative Spend of Churned Customers

BUSINESS PROBLEM

A subscription business losing nearly half of its customers (30,493 of 64,374) with no visibility into when or why they leave, reacting to losses instead of preventing them.

ANALYTICAL APPROACH

Cleaned 64,374 records in Power Query (completeness, uniqueness, validity, consistency checks). Ran t-tests and chi-square tests, a logistic model (Pseudo R^2 0.43), and built 6 DAX measures: churn rate, odds ratio, Cohen's d (1.34 payment delay, 0.64 support calls).

BUSINESS DECISIONS

A/B test a payment alert at Day 10, before churn jumps past 15 days. Reach out proactively at a customer's 4th support call, before the jump at the 5th. Move monthly customers to longer contracts.

FINANCIAL IMPACT

The 30,493 churned customers spent about $15.8M in total ($519 each): that is the exposure. A forward saving cannot be measured, since the data has no MRR or cancellation dates. Illustrative only: retaining 5% (1,525) is about $792K ($475K to $1.58M at 3% to 10%).

What the Data Actually Revealed

1	**77%** Churn at 21-30 days late	Payment delay is the strongest signal: churn stays near 10% up to 15 days, then jumps to 59% at 16-20 days and 77% at 21-30 days (Cohen's d = 1.34, correlation 0.56). An alert at Day 10 is the intervention to test, since correlation alone does not prove it will cut churn.
2	**61%** Churn at 5+ support calls	Support calls show a cliff at the fifth call: churn is about 24% up to 3 calls, 32% at 4 calls and 61% at 5 or more. Support calls are the second driver (Cohen's d 0.64); the business can act at call 4. Spend barely differs ($519 churned vs $561 retained, d = 0.16), so churn is a behavior problem, not a spend problem.
3	**62.4%** Women on monthly contracts	Female customers churn at 55.05% versus 38.58% for males (odds ratio 0.51). The worst segment is women on monthly contracts: 62.4% churn, against 38.2% for men on monthly contracts.
4	**51.61%** Monthly vs 44.05% quarterly	Commitment matters, tier does not: monthly contracts churn at 51.61% versus 44.05% for quarterly plans, while Basic, Standard and Premium sit within two points (48.28%, 47.33%, 46.50%).

Bottom Line: Churned customers represent about $15.8M of spend already lost. Payment delay and support calls show who to call first; a 5% save is worth about $792K (illustrative).

CASE STUDY 02

E-Commerce Revenue: Turning $32M in Data into Growth Strategy

Excel · Power Query · Power BI · DAX · 50,000 Orders · 2022-2023 · Public dataset (Kaggle) · 2026

$32.87M	50K	$657	$5.05M
Total Revenue	Total Orders	Average Order Value	Revenue Given Up in Discounts

BUSINESS PROBLEM

$32.87M in revenue with no consolidated view of which products, regions, periods or discount levels drive growth, while $5.05M is given up in discounts. Without that view, pricing and marketing rely on instinct.

ANALYTICAL APPROACH

Loaded the Sales_Data table (2022-2023) into a Power BI model with 12 DAX measures (revenue, orders, AOV, YoY growth, discount loss, recoverable revenue) across 6 categories, 4 regions and 5 payment methods. Source data looks synthetic.

BUSINESS DECISIONS

Re-price the 30%-off tier to 20%: its 8,334 orders sold 2.98 units each, the same as orders with no discount (2.99). Stop planning around a February dip, since revenue per day is flat across the year.

FINANCIAL IMPACT

The $5.05M given up is 15.4% of revenue. Re-pricing the 30%-off orders to 20% recovers $620,954 at the same units; the measure covers only that tier, so treat it as a minimum.

CASE STUDY 02 — KEY INSIGHTS

Revenue Intelligence: What $32M Revealed

1	**≈3.0** Units per order, every discount level	Discounts did not sell more: units per order are about 3.0 at every discount level from 0% to 30% (correlation 0.001), while average order value falls from $749 to $522. The $5.05M given up (15.4% of revenue) bought no measurable volume.
2	**$143K** Beauty's lead over Sports	The portfolio is flat. Beauty leads at $5.55M but Sports trails by only about $143K, the top 5 products earn about $18K each (0.06% of revenue), and all four regions sit between $8.1M and $8.3M.
3	**+0.54%** 2023 growth over 2022	There is no real seasonality. February looks weak ($2.51M vs $2.88M in January) only because it has fewer days; revenue per day stays between $43.8K and $46.5K all year. Growth is flat too: 2023 was +0.54% over 2022.
4	**r = -0.01** Rating vs revenue, 4,000 products	Ratings do not explain revenue: across 4,000 products the correlation between rating and revenue is -0.01, and the average rating is 3.00. Five payment methods split evenly at about 20% each.

Bottom Line: Re-pricing the 30%-off tier to 20% recovers $621K with no loss of units. The data gives no reason to plan around seasonality.

CASE STUDY 03

HR Risk Analytics: Flagging Exit Risk Before the Resignation Letter

Excel · Power Query · Power BI · DAX · 1,470 Employees · Public dataset (Kaggle) · 2026

16.1%	237	309	≈$6.8M
Attrition Rate	Employees Already Left	Current Employees Flagged High Risk	Est. Annual Cost of Exits (Assumed)

BUSINESS PROBLEM

An organization of 1,470 employees loses 16.1% of its workforce (237 people) and only finds out after the resignation. Nobody knows which remaining employees are next, or which departments and roles drive the exits.

ANALYTICAL APPROACH

Loaded 1,470 employees x 34 columns, translated RiskCategory values to English in Power Query, confirmed 237 leavers, and built DAX measures for attrition by department, role and overtime. Risk category is a screening tool, not a validated model.

BUSINESS DECISIONS

Review incentives and workload for Sales Representatives (39.8%, 33 of 83 people), set an overtime limit, run focused exit and retention talks in Sales and HR, and give the 309 High-risk employees individual retention plans. Track the dashboard monthly or quarterly.

FINANCIAL IMPACT

Illustrative: 237 leavers x $28,723 (50% of $57,445, the average annual pay of leavers) = about $6.8M. The 50% rate is an outside assumption; the data has no currency, so USD is assumed, and it may not cover exactly one year.

Attrition Risk: 4 Findings That Change HR Strategy

1	**309** High-risk current employees	Of 1,233 current employees, 570 are Low risk, 354 Medium and 309 High: about a quarter are High risk, while 237 (16.1%) have already left. The categories are a screening tool, so review the rule behind them before acting on individuals.
2	**30.5%** Overtime vs 10.4% without	Employees working overtime leave at 30.5% versus 10.4% for those who do not, about 3x the rate. It is the strongest factor in this analysis; check it against job role before calling it the cause.
3	**39.8%** Sales Representatives (33 of 83)	Sales Representatives leave at 39.8% (33 of 83 people), about 2.5x the company average of 16.1%, about 1.7x the next roles: Laboratory Technicians (23.9%, 62 of 259) and Human Resources (23.1%, 12 of 52). Sales Representatives are a small group, so treat the rate as a strong signal rather than a precise figure.
4	**20.6%** Sales dept vs 13.8% in R&D	The problem is concentrated, not company-wide: Sales 20.6% (446 people), Human Resources 19.0% (63), Research & Development 13.8% (961), even though R&D is the largest department. Target pockets, not a general program.

Bottom Line: Exits cost an estimated $6.8M a year (assumption-based). Start with Sales Representatives (33 people), overtime limits and the 309 High-risk employees.

CASE STUDY 04

Sales Dashboard Rebuild: Hidden Seasonality

Excel · Power Query · Power BI · DAX · 9,223 Order Lines · 2014-2017 · Public dataset (Kaggle)

5.6x	$2.12M	12.3%	-127%
Nov vs Feb Sales Gap	Total Sales	Profit Margin ($261K Profit)	Margin at 61%+ Discount

BUSINESS PROBLEM

The executive dashboard showed a near-flat monthly line because the calendar table was not linked to sales, hiding seasonality, plus three other faults that made it unreliable.

ANALYTICAL APPROACH

Built a DAX calendar table linked to sales, added a numeric month sort, removed a duplicate filter, added a region filter, fixed the margin format, and tuned 6 DAX measures.

BUSINESS DECISIONS

Adopt it as the single sales reference, review the calendar link quarterly, cap discounts (margin is negative above 20%, -127% at 61%+), and reuse one theme.

FINANCIAL IMPACT

No exact figure is derivable. Planning assumption: 2% to 4% of $2.12M total sales = $42K to $85K (a four-year base, 2014-2017), not a measurement.

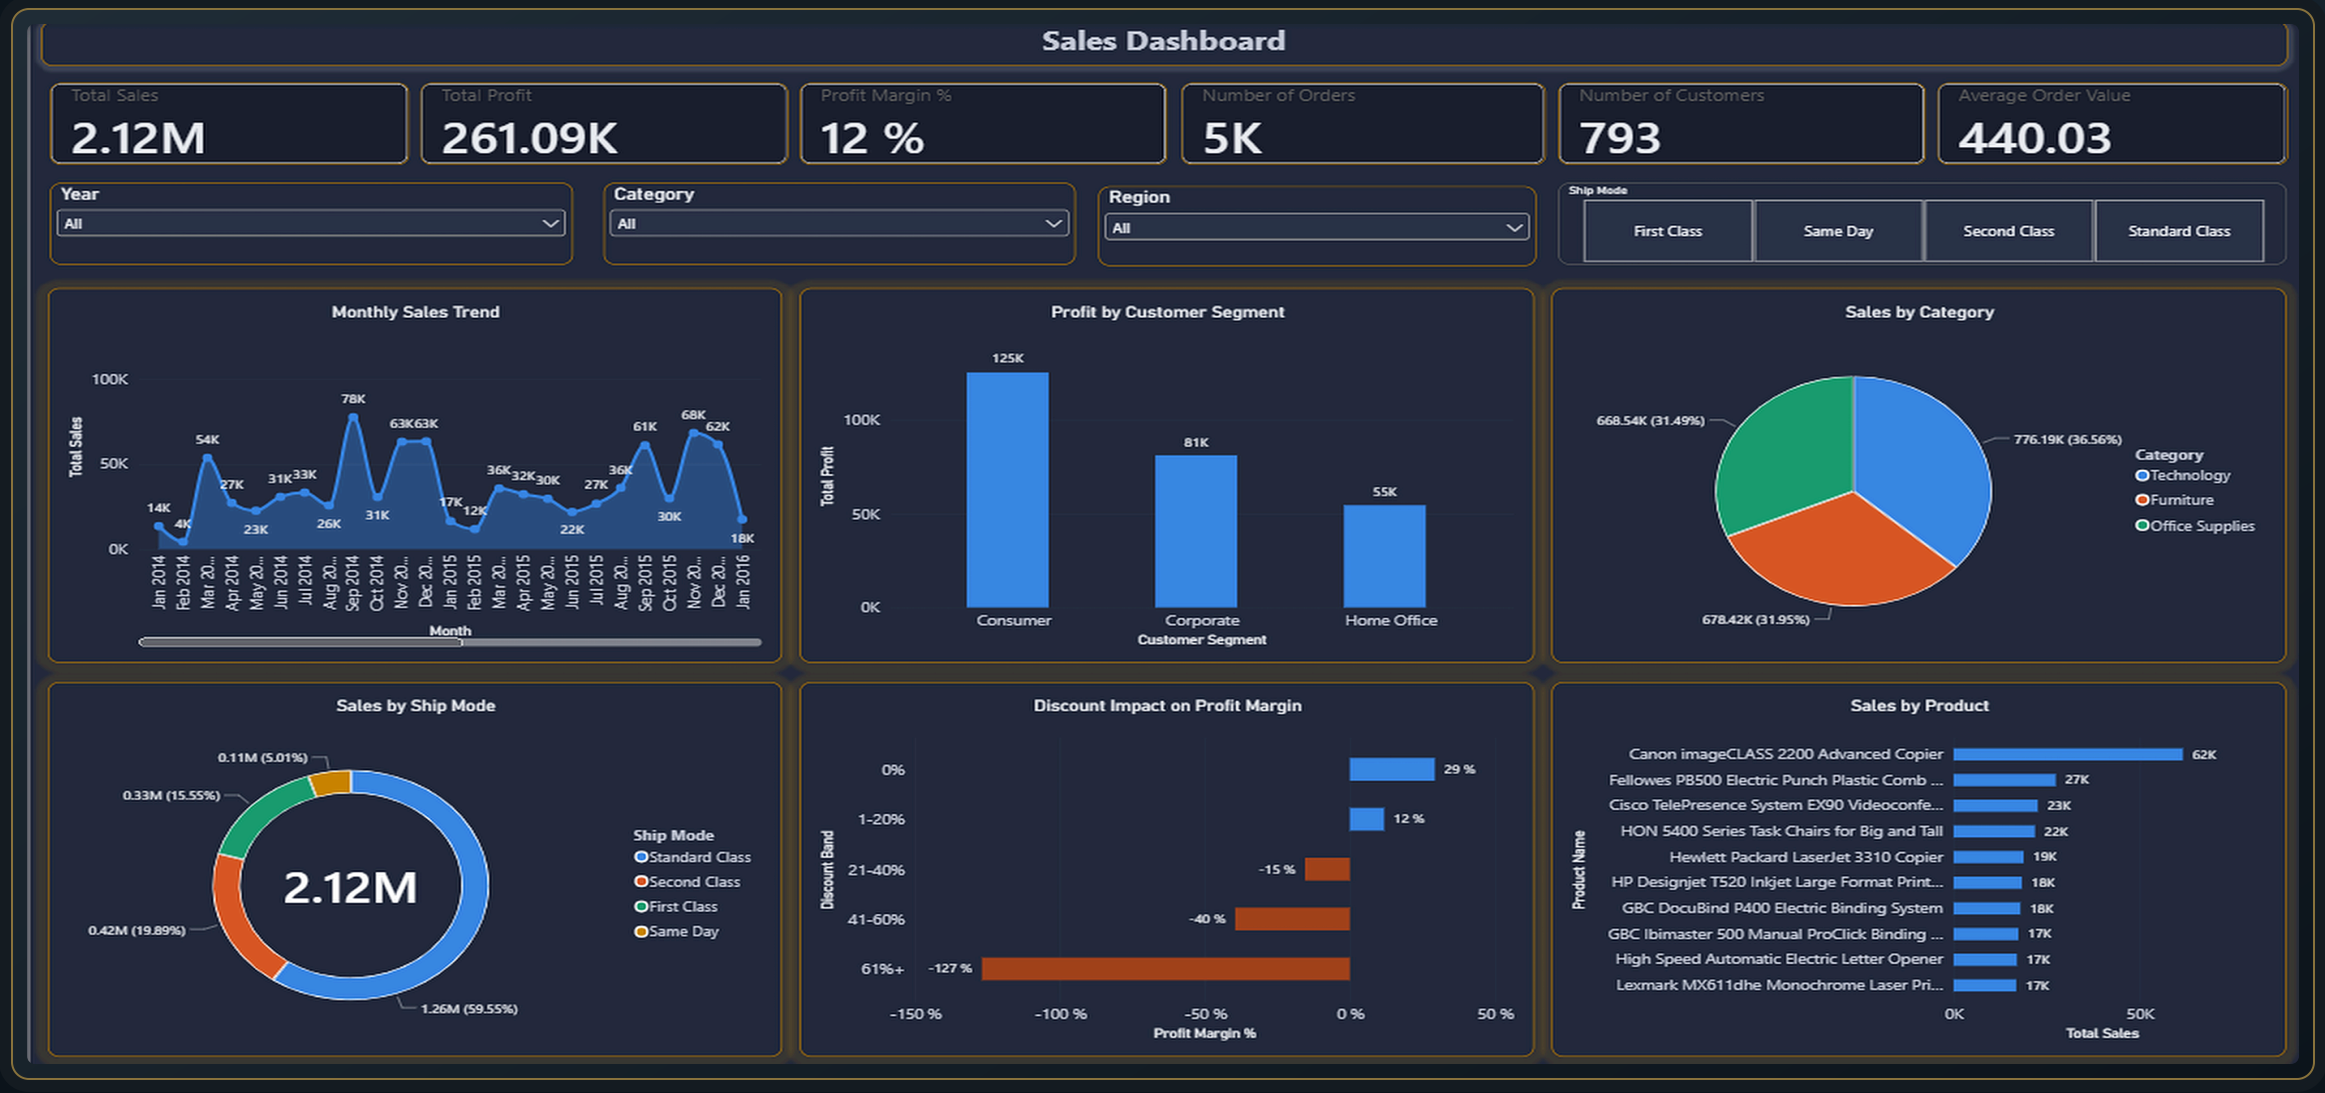

Profitability: What the Discount Bands Revealed

1	**5.6x** November vs February	The real seasonal gap was 5.6x between the best month (November) and the worst (February), fully hidden behind a nearly flat line until the calendar relationship was fixed.
2	**-127%** Margin at 61%+ discount	Overall margin is 12.3% ($261,087 profit on $2,123,160 sales). Discounts are the leak: margin is 29% with no discount and 12% at 1-20%, then -15% (21-40%), -40% (41-60%) and -127% (61%+).
3	**$125K** Consumer profit, 48% of $261K	West is the top region (31.7% of sales) and Technology the top category (36.6%). Consumer customers generate $125K of the $261K profit (48%), and one product stands out: the Canon imageCLASS 2200 copier sold $62K.
4	**4** Dashboard faults fixed	A dashboard is only useful if leaders can trust it: a missing relationship, a wrong sort order, a duplicate filter and a mis-formatted margin each weakened it. Fixing them made it fit to be the single reference in executive meetings.

Bottom Line: The rebuilt dashboard exposes a 5.6x seasonal swing and a margin that turns negative as discounts deepen. Financial impact is a planning range ($42K to $85K), not a measurement.

Sales Dashboard: Profitability & Discount Impact

METHOD & ASSUMPTIONS

How to Read the Numbers

All four projects use public Kaggle datasets built for practice. Dollar figures are scenario estimates, not realized results.

01 Customer Churn

DATA Kaggle churn data, 64,374 records; statistically too clean, so likely synthetic (training data).

ASSUMPTION $15.8M = 30,493 churned x $519 cumulative spend (history, not a forecast). $792K is an illustrative 5% save.

NEXT STEP A/B test the Day-10 payment alert and the 4th-call outreach against control groups.

02 E-Commerce

DATA Kaggle e-commerce orders, 50,000 rows, 2022-2023; flat distributions suggest synthetic data.

ASSUMPTION $621K = 8,334 orders at 30% off re-priced to 20% at the same units. It covers only the 30% tier.

NEXT STEP Pilot the lower cap and track units per order at each discount level.

03 HR Attrition Risk

DATA Kaggle HR attrition data, 1,470 employees x 34 columns.

ASSUMPTION $6.8M = 237 x $28,723 (50% of leavers' avg annual pay, $57,445). USD assumed; the data has no currency.

NEXT STEP Test the 50% rate against replacement-cost benchmarks and back-test the risk rule.

04 Sales Profitability

DATA Kaggle retail sales, 9,223 rows, Jan 2014 to Dec 2017.

ASSUMPTION $42K to $85K = 2% to 4% of $2.12M total sales (four-year base).

NEXT STEP Measure discount losses by category and add cost data before quoting a financial figure.

THANK YOU

The Work Speaks. Let's Talk Strategy.

Available for Data Analyst and Business Analyst roles in Riyadh.
Ready to turn your data into decisions.

The same pattern in all four projects: spot the leak early, decide, then quantify it, with every assumption stated.
